

Pipe Floaters

Wardle Marine Services Ltd

Pipe Floaters are commonly used for dredging works and sewage waste pipes. We have five different sizes, but can design and manufacture (subject to time and cost variations) bespoke shapes and sizes according to your requirements. The floaters are filled with polyurethane or polystyrene, so in any case of damage they will continue to float. The bodies are corrosion resistant and generally they have a life span three times that of steel or concrete floaters.

The floaters are produced in the following sizes:

- 220L volume, 24kg weight, 31.5cm pipe diameter, 185kg floating capacity.
- 600L volume, 63kg weight, 45cm pipe diameter, 600kg floating capacity
- 800L volume, 67kg weight, 60cm pipe diameter, 800kg floating capacity
- 800L volume, 55kg weight, 87.7cm pipe diameter, 800kg floating capacity.
- 1000L volume, 86kg weight, 55cm pipe diameter, 1000kg floating capacity.

They can be produced in red or yellow, at your request.
