

Safety Barriers

Safety Barriers are used for setting your own limits, to secure your marina and to provide low to medium security at sea or on lakes.

They can be used in areas where high visibility is compulsory, such as open seas and oceans, areas with high waves, strong currents and dams.

The barriers are created by a combination of parts, so if one is damaged it can be easily replaced without interrupting the rest of the system.

The barriers consist of individual modules joined together with galvanized chain and clamps.

The polyethylene modules are durable and UV resistant.

Standard or custom warning labels can be fixed to the separate parts, which are produced in yellow, orange, white or custom colors.

Due to their foam filling, the units are shock resistant, unsinkable and have high visibility and buoyancy.
